

Rotobec Power Attachment (RPA) – Pulpwood

The Rotobec Power Attachments (RPA) are designed to be up for anything. Our line of RPA's are available with 6 different jaw configurations (Rake, Bucket, Pulpwood, Trash, Demolition & Compaction). All equipped with our built-in-house 5,000 PSI high pressure cylinders and protected by 3/8" steel cylinder guarding. Rotobec re-designed the Pulpwood version, RPA60100P08H, to increase ease of bunching

wood.

The center fingers on each jaw were removed to prevent the jamming of small logs. The jaws of the RPA – Pulpwood have a Pulpwood Grapple configuration style and the inside area (tip to tip) is a perfect 8 ft², so as to not overload the material handler. This heavy duty grapple was specifically designed for extreme applications, is backed by Rotobec's 18 month/3,000 hour warranty and was proudly designed and manufactured in North America.

Improved Rotobec Clamshell Bucket

Rotobec Clamshell Buckets (CSB) set the industry benchmark for strength and durability. The quad-cylinder design ensures the optimal force distribution on each corner of your bucket, providing maximum loads. Rotobec significantly improved the CSB650 to minimize maintenance time; this improvement automatically greases the attachment, simply using the motion of the bucket to do so. The attachment structure was also modified to adapt the jaw of the CSB400HD onto the CSB650 head. These custom jaws are equipped with bucket teeth, allowing better penetration in frozen coal

and less stress on the grapple structure. These enhancements were designed for a customer to handle coal anthracite in Russia throughout both summer and winter time in high humidity. Rotobec's team works closely with any customers with unique requirements, needing a custom design.
