

LWT Mud Cat 40E Used to Create New Sewage Systems in 40 Peruvian Villages
JANUARY 29, 2015

CHIMBOTE, PERU — An initiative to provide sanitary sewer systems to 40 villages in the southern district of New Chimbote was being delayed by a series of overfilled treatment/oxidation ponds.

Excess soil accumulation combined with high sludge levels reduced the ponds' original design capacities and created a toxic flooding hazard in the event of heavy rains.

The solution was to deploy a Liquid Waste Technology Mud Cat 40E Dredge which is engineered to remove not only sludge but also excess soil accumulation.
